

1.0A Adjustable Voltage High Speed LDO Regulators PF1117 Series

General Description

The PF1117 series are highly accurate, low noise, LDO Voltage Regulators that are capable of providing an output current that is in excess of 1.0 A with a maximum dropout voltage of 1.3 V at 1.0A. This series contains six fixed output voltages of 1.2 V, 1.8 V, 2.5 V, 3.3 V, and 5.0 V that have no minimum load requirement to maintain regulation. Also included is an adjustable output version that can be programmed from 1.25 V to 15 V with two external resistors. On chip trimming adjusts the reference/output voltage to within $\pm 2.0\%$ accuracy. Internal protection features consist of output current limiting, safe operating area compensation, and thermal shutdown. The PF1117 series can operate with up to 15 V input. Devices are available in SOT223, TO252-2L.

Features

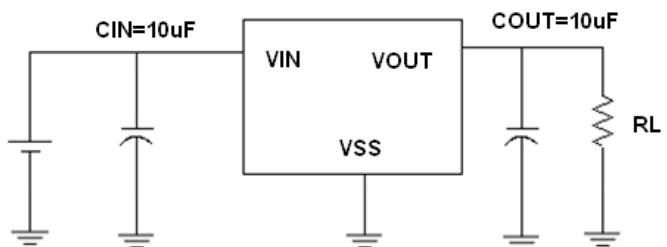

- Output Current in Excess of 1.0A
- Dropout Voltage: 1.07V@ $I_{OUT} = 100mA$
- Operating Voltage Range: 4.8V~15V (ME1117A33)
- Highly Accuracy: $\pm 2\%$
- Adjustable Output Voltage Option
- Standby Current: 3mA (TYP.)
- High Ripple Rejection: 60dB@1KHz(PF1117A33)
- Line Regulation: 0.1% (TYP.)
- Temperature Stability $\leq 0.5\%$
- Current Limit (1.3A)
- Thermal Shutdown Protection (160°C)
- Small Packages:SOT223, TO252-2L

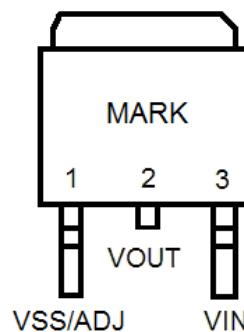

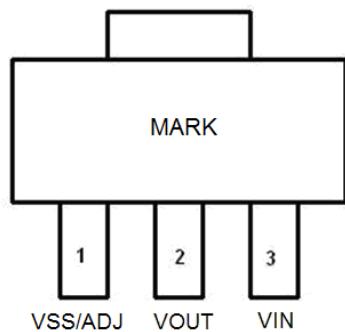

Typical Application

- Consumer and Industrial Equipment Point of Regulation
- Switching Power Supply Post Regulation
- Hard Drive Controllers
- Battery Chargers

Typical Application Circuit

Note :

1 . V_{DIF} : $V_{IN1} - V_{OUT}(E)'$

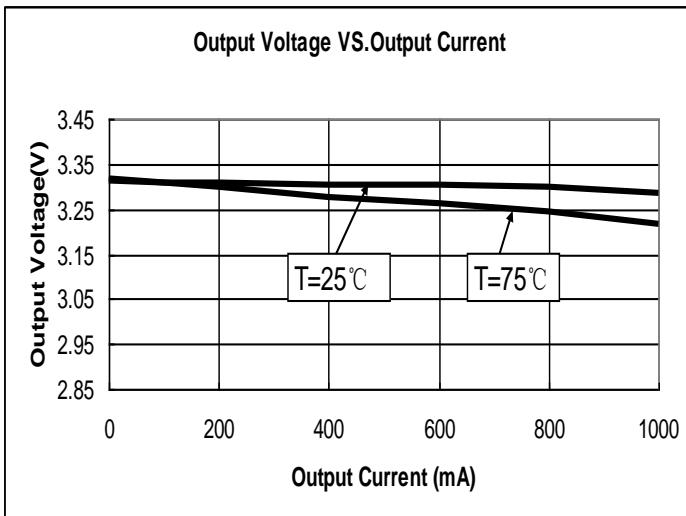

V_{IN1} : The input voltage when $V_{OUT}(E)'$ appears as input voltage is gradually decreased.

$V_{OUT}(E)' =$ A voltage equal to 99% of the output voltage whenever an amply stabilized I_{OUT} and $\{V_{OUT}(T) + 1.5V\}$ is input.

Applications Information

➤ Introduction

The PF1117 features a significant reduction in dropout voltage along with enhanced output voltage accuracy and temperature stability when compared to older industry standard three-terminal adjustable regulators.

➤ Output Voltage

The typical application circuit for adjustable output regulator is shown in following Figure. They develop and maintain the nominal 1.25 V reference voltage between the output and adjust pins. The reference voltage is programmed to a constant current source by resistor R1, and this current flows through R2 to ground to set the output voltage. The programmed current level is usually selected to be greater than the specified 3.0mA minimum that is required for regulation. Since the adjust pin current, I_{ADJ} , is significantly lower and constant with respect to the programmed load current, it generates a small output voltage error that can usually be ignored.

$$V_{out} = V_{ref} \left(1 + \frac{R_2}{R_1} \right) + I_{adj} R_2$$

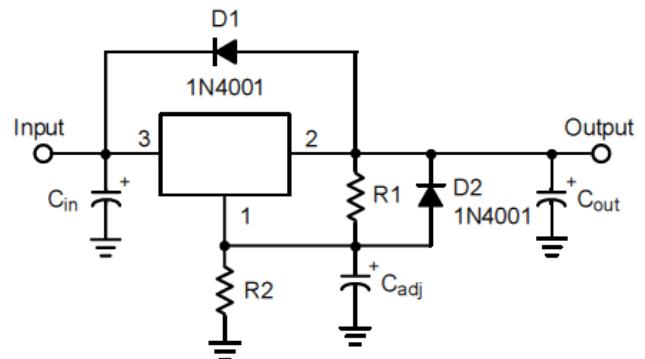

➤ External Capacitors

Input bypass capacitor C_{IN} may be required for regulator stability. This capacitor will reduce the circuit's sensitivity when powered from a complex source. A 10uF ceramic or tantalum capacitor should be adequate for most applications. Frequency compensation for the regulator is provided by capacitor C_{OUT} and its use is mandatory to ensure output stability. A minimum capacitance value of 4.7uF with an equivalent series resistance (ESR) that is within the limits of 0.25 ohm to 2.2 ohm is required. Higher values of output capacitance can be used to enhance loop

stability and transient response with the additional benefit of reducing output noise. The output ripple will increase linearly for fixed and adjustable devices as the ratio of output voltage to the reference voltage increases.

➤ Protection Diodes

The PF1117 has two internal low impedance diode paths that normally do not require protection when used in the typical regulator applications. The first path connects between V_{OUT} and V_{IN} , and it can withstand a peak surge current of about 15 A. Only when V_{IN} is shorted to ground and C_{OUT} is greater than 100uF, it becomes possible for device damage to occur. Under these conditions, diode D1 is required to protect the device. The second path connects between C_{ADJ} and V_{OUT} , and it can withstand a peak surge current of about 150mA. Protection diode D2 is required if the output is shorted to ground and C_{ADJ} is greater than 10uF.

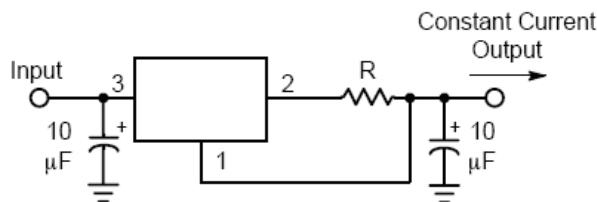

➤ Thermal Considerations

This series contains an internal thermal limiting circuit that is designed to protect the regulator in the event that the maximum junction temperature is exceeded. When activated, typically at 175°C, the regulator output switches off and then back on as the die cools.

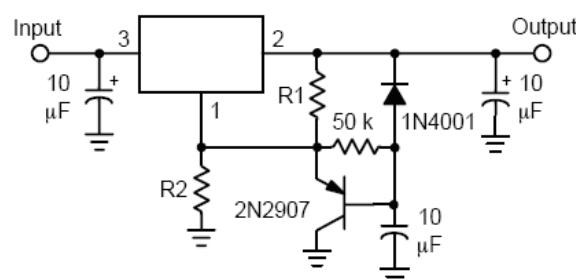

Other Application Circuit

(1) Constant Current Regulator

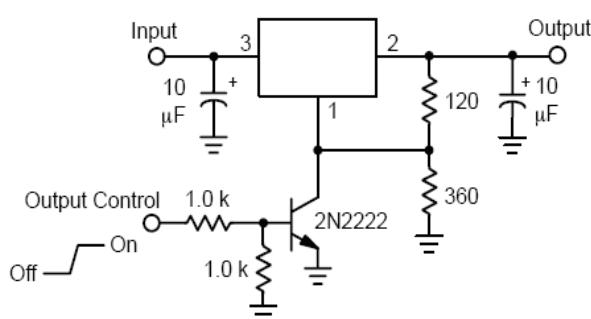

$$I_{out} = \frac{V_{ref}}{R} + I_{adj}$$

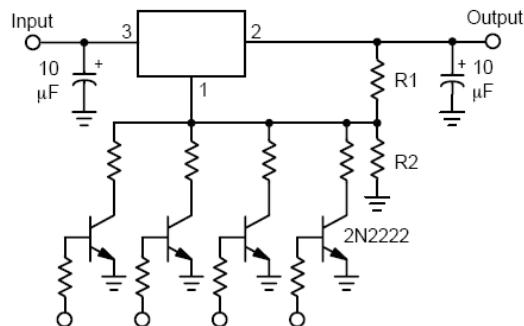

(2) Slow Turn-On Regulator

(3) Regulator with Shutdown

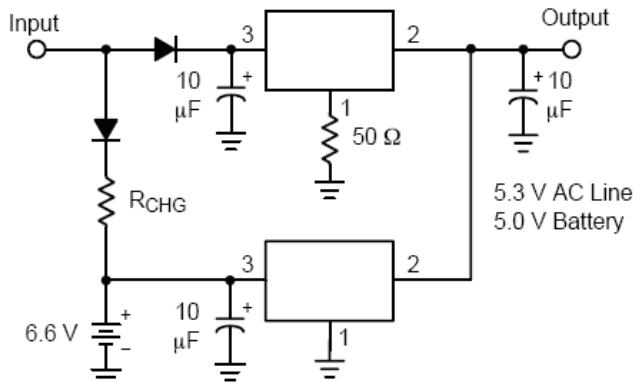

(4) Digitally Controlled Regulator

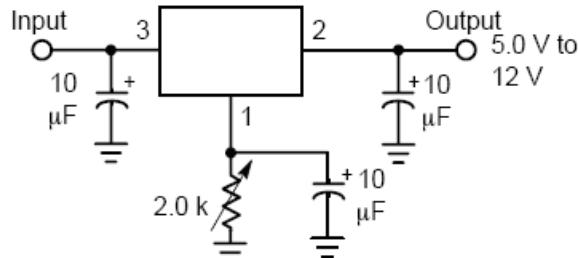

Resistor R2 sets the maximum output voltage. Each transistor reduces the output voltage when turned on.

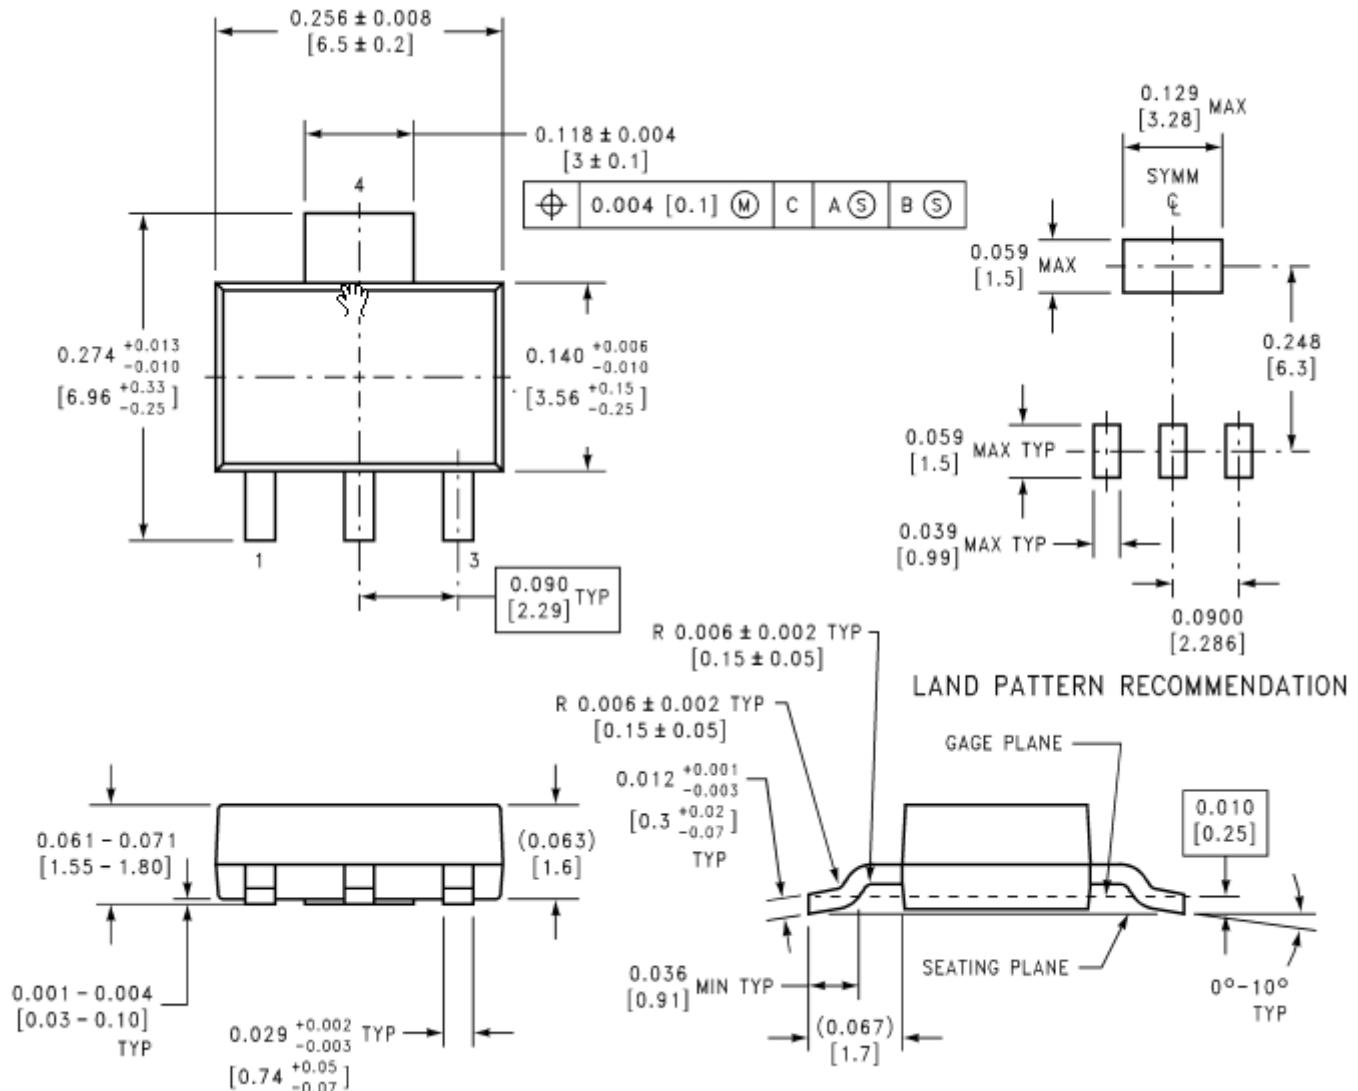

(5) Battery Backed-Up Power Supply

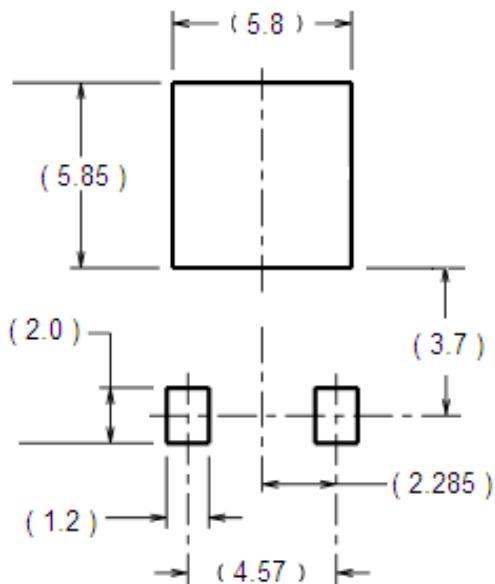

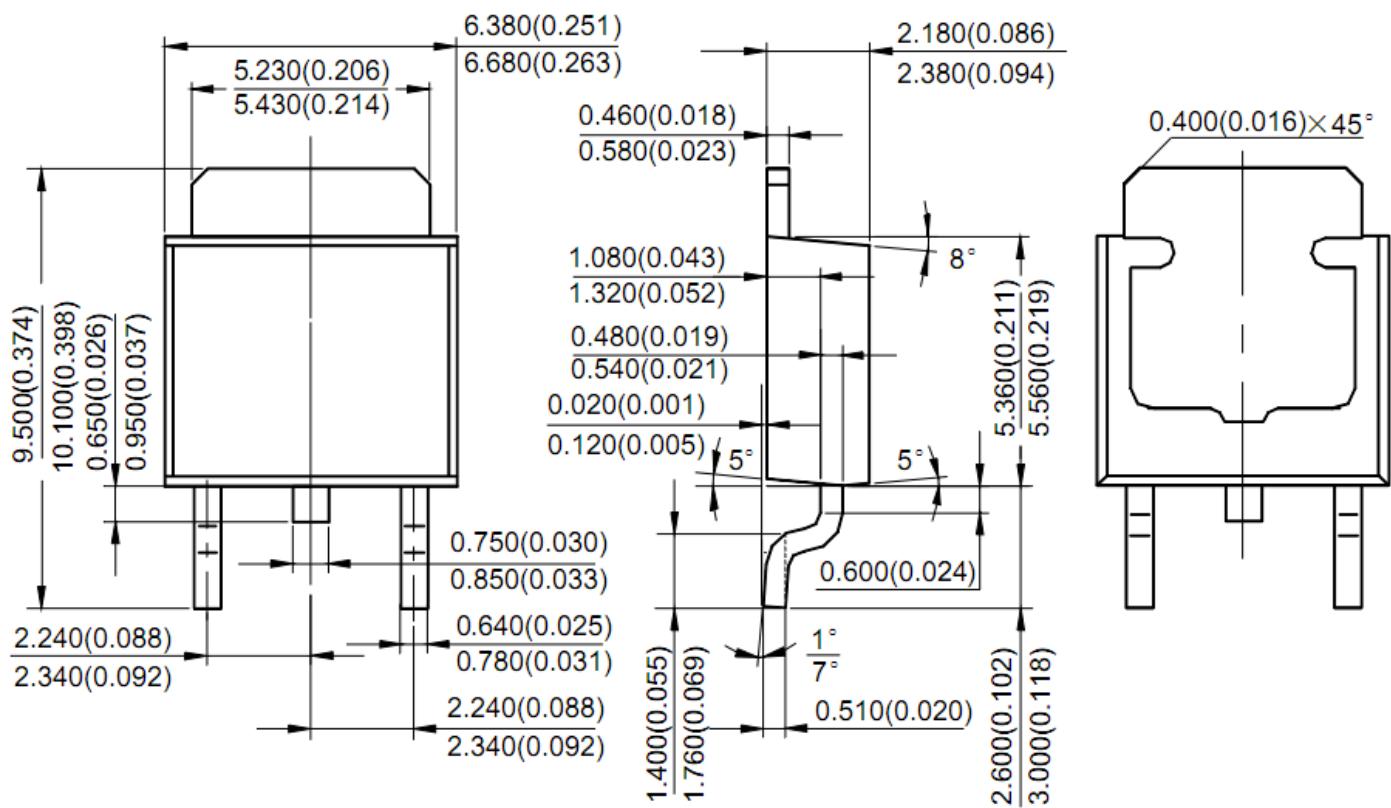

(6) Adjusting Output of Fixed Voltage Regulators

The 50 ohm resistor that is in series with the ground pin of the upper regulator level shifts its output 300 mV higher than the lower regulator. This keeps the lower regulator off until the input source is removed.
